

The chart above represents the NTP Performance of Southern Luzon cities in terms of Case Detection Rate (finding TB cases) and High Treatment Success Rate (cases with smear positive given complete set of treatment and sputum examinations for six months). The ideal is cities must be located within the quadrant of High CDR and TSR/ CR and only two cities – Lipa and Calamba – have attained it. It is observed that there is an improving performance among SL cities in terms of CDR and TSR. However, there is a need to sustain the gains of these high performances.
